Venous Leg Ulcer

What is a Venous Leg Ulcer?

A wound that is formed due to improper functioning of Venous valves, leading to increased pressure in veins of the lower legs. Typically, found around the ankles.

Symptoms include:

- Swelling
- Itching
- Pain
- Blood pools in the veins causing increase pressure and damage.

JOBST® FarrowWrap® Short-Stretch Compression Wrap

FarrowWrap® is the Elastic Short-Stretch garment that gives the benefits of bandaging without the hassle.

Burns

What is a Burn?

Minor burns, also known as first-degree burns, are superficial burns that only affect the outermost layer of the skin. They typically result from brief contact with hot objects, hot liquids, steam, or exposure to the sun. These burns usually cause pain, redness, and small blisters.

Accidental burn injuries caused by bathing, cooking or using heating pads, are often encountered in our patient population with deeper or more severe burns often seen in diabetic patients with neuropathy, as these patients may not detect painful stimuli from the heat sources.¹

Cutimed® Sorbact® Gel

Impregnated with hydrogel; for dry wounds

Pressure Ulcers

What is a Pressure Ulcer?

A pressure ulcer is defined as localized damage to the skin and underlying soft tissue usually over a bony prominence.

Critically ill patients are generally not able to notice increased tissue pressure and to react accordingly. Underlying diseases, hemodynamic instabilities and oxygenation disorders increase the risk of developing a pressure ulcer.

Cutimed® Sorbion® Border Sacrum

Cutimed® Sorbion® is a sterile, superabsorbent, gel-forming, self-adhesive wound dressing, offering atraumatic dressing changes. The dressing consists of a superabsorbent core with high retention capacity, a wound contact layer made from a hypoallergenic polypropylene, a silicone adhesive border and a breathable, waterproof backing from polyurethane which allows patients to shower.

Diabetic Ulcers

What is a Diabetic Ulcer?

A Diabetic ulcer is a wound on the foot of a patient with diabetes mellitus. The Clinical signs vary depending on overall health conditions, such as: Underlying diseases (e.g. Neuropathy, PAD) or can be typically located at mechanically stressed area.

Risk Factors:

Most commonly caused by a combination of trauma, poor circulation, nerve damage and wounded feet

- Trauma or previous foot ulcer
- Poorly fitted or poor quality shoe
- Poor hygiene; improper trimming of toe nails
- Age or male gender
- Health conditions or underlying diseases

Cutimed® Off-Loader Select Total Contact Cast

The Cutimed® Total Contact Cast Kit has been developed in partnership with healthcare professionals dealing with diabetic foot ulcers every day. The result is a recipe that offers the most effective TCC through an easy standardized technique. It combines specifically chosen and proven casting materials to provide an intimate close fit and proper pressure redistribution for an optimized healing environment.

Exudate Management

What is Exudate Management?

Exudate management is important to ensure the optimal balance of moisture with the skin. Excess exudate should be absorbed into the dressing polymers and captured there. This process ensures that there is still moisture on

the wound side of the product, but excessive exudate is transported away from the wound. The superabsorbent polymers form into a soft gel with a moist outer shell once they absorb exudate.

Cutimed® Sorbion® Super-Absorbent Wound Dressing

Cutimed® Sorbion® dressings have the excellent ability of quickly absorbing large amounts of exudate and locking it within their inner core, even under compression, therefore reducing the frequency of dressing changes. Cutimed® Sorbion® dressings also have the potential to remove chronicity-causing factors and thereby support wound healing; they provide gentle debridement, reduce the concentration and activity of MMPs and immobilize micro-organisms. The unique fiber matrix offers stability even when highly saturated, thus preventing the formation of lumps and pressure points and ensuring maximum wound contact.

BioBurden Control

What is BioBurden?

Bioburden is bacteria that lives on a non-sterilized surface. Reduced bioburden supports the natural wound healing. Removal of bioburden is achieved

through the removal of loose materials on the wound surface by rinsing, irrigating and wiping with e.g. wet gauze.

HYDROFERA BLUE® Non-Cytotoxic, Antibacterial Wound Dressings

HYDROFERA BLUE® has unique, Non-cytotoxic, antibacterial wound dressings that address all 3 factors of Local Wound Care:

- Infection management - absorbs and kills bacteria in the dressing
- Moisture management - wicks bacteria out and away from the wound
- Flattens rolled wound edges

Cutimed® Sorbact® Non-Cytotoxic, Antibacterial Wound Dressings

Cutimed® Sorbact® utilizes a physical mode of action versus a chemical mode of action. The hydrophobic interaction safely removes bacteria without cell death or negatively impacting the healing process. Other antimicrobial dressings on the market utilize alternative antimicrobials to kill bacteria or fungi, leaving behind bacterial cell debris and endotoxins.

Incisions & Post-operative Care

There are steps you can take to minimize the risk of surgical site infections at every stage of the patient journey.

Post-operative

- Early mobilization and nutrition
- Wound monitoring
- Patient education and involvement

In surgical wounds, it is particularly important to monitor the patient's health and healing progress, identifying whether the incision is healing well or if there are signs and symptoms of healing impairment that may lead to complications.¹ Well-recognized strategies like 'undisturbed wound healing' for patient engagement should be used to aid early identification of SWC wherever necessary (e.g. dressings that allow visibility without removal).²

Leukomed® T Plus Waterproof Adhesive Transparent Sterile Dressing With Absorbent Pad

Leukomed® T plus is a sterile, breathable, waterproof, transparent film dressing with a highly absorbent wound pad for secreting wounds.

Leukomed® Sorbact®

Antimicrobial Waterproof Transparent Sterile Dressing With Absorbent Pad

If surgical circumstances or patient risk factors increase the likelihood of an infection or if the wound is already contaminated, Leukomed® Sorbact® is the right choice. Purely by its physical mode of action, it binds microbes to the pad and helps to prevent critical colonization.

Leukomed® Non-Woven

Adhesive Sterile Dressing With Absorbent Pad

Leukomed® adhesive dressing is composed of an acrylic adhesive and non-woven substrate with a highly absorbent wound pad for secreting wounds. The adhesive which is not made with natural rubber latex, enables easy removal, and the non-adherent layer prevents adhesion to the wound.

Skin Sensitive

Injuries to the skin are caused through the mechanical forces which occur during the traumatic removal of adhesive tape and dressings.

This can cause unnecessary pain, infections, work and costs.

(A systematic review reports a prevalence of skin tears of up to 22% ¹.)

Whose Skin is most at Risk of Skin Damage?

- Elderly patients
- Infants
- Patients on certain medications
- Patients with frequent dressing changes
- Patients with disease-related fragile skin

Hypafix® skin sensitive Soft & Secure Fixation For Fragile Or Sensitive Skin

Hypafix® skin sensitive is designed especially for use on patients with fragile or compromised skin. The soft silicone adhesive helps to protect against adhesive related injuries.

Leukomed® skin sensitive

Absorbent Dressing For Wound Protection On Fragile Or Sensitive Skin

Leukomed® skin sensitive solutions combine atraumatic, almost pain-free removal with reliable adhesion. The reason is the use of silicone instead of acrylic or even rubber. Silicone offers great adhesion but doesn't "glue" to the skin the way traditional adhesives do.

Minor Wounds

What are Minor Wounds?

Cuts are breaks or openings in the skin caused by a sharp object or trauma. Cuts can vary in size, shape, and depth. Some cuts may result in minimal bleeding, while others can cause significant bleeding, depending on the blood vessels involved.

First aid dressings are used for the treatment of minor or common wounds. Our Leukoplast portfolio offers a broad

variety of different shapes and sizes to cover all your needs and prepares you for the unexpected.

Small accidents at home can happen pretty fast: just think about daily activities like cooking, gardening or home improvement projects. First aid dressings should be part of your first aid cabinet to cover minor wounds like cuts or abrasions.

Leukoplast® soft white Non-Woven Adhesive Dressing In Roll Format

Leukoplast® soft white is made of highly flexible polyester to allow full freedom of movement, let the skin breathe and dry quickly if wet. Comfortable for the patient, it can stay in place for the duration of treatment.

Fixation Bandages

What is Fixation?

Fixation is not a one size fits all situation.

Primary fixation is the use of tubes, catheters, measuring devices and instruments. Secondary Fixation is the use of dressing fixations.

Fixation Challenges:

- Skin types e.g. fragile skin
- Contours or moving joints
- Exposure to water

Suboptimal Fixation Solutions Can Cause:

- Loose/ leakage
- Skin irritation/damage
- Unsuitable, unreliable fixation

Transparent Dressings

Leukomed® T Waterproof Adhesive Transparent Sterile Film

Leukomed® T is a sterile, breathable, waterproof, transparent film dressing designed to cover catheter or wound sites while providing a barrier to external contaminants such as bacteria, blood and body fluids.

Easifix® Cohesive Self-Adhesive Fixation Bandage

Easifix® Cohesive has remarkable body moulding properties and conforms to awkward bony prominences without impairing movement. The cohesive coating ensures that the bandage sticks only to itself and not the patient's skin or clothing. The bandage can be reapplied to the same patient, thus permitting routine wound inspection.
